

Langley Scissor Lift Operator Certification

Langley Scissor Lift Operator Certification - Regulations within North America typically recommend that operators of booms, scissor lifts or aerial work platforms all obtain operator certification. Scissor lift operator certification is not mandatory, but there are benefits to making sure that this particular training is provided to all the operators.

Scissor lift is a platform which vertically moves to allow workers to reach high levels. Scissor lifts are made together with a pantograph - attached, folding supports in an 'X' pattern. Upward movement takes place when pressure is applied to the outside of the lowest set of supports, propelling the work platform vertically by elongating the 'X' pattern. A bridge extends from particular platforms to allow convenient access to the work place.

With the manual release of the valve, the platform is able to return to the ground. The descent is achieved by simply releasing the hydraulic or pneumatic pressure. This is the main reason that scissor lifts are the machinery of choice at worksites.

Operators which are both experienced or inexperienced would be able to get some benefit from right scissor lift training. A scissor lift operator certification course could be specifically designed to accommodate for those lifts used at your workplace. The trainees' certificate of training would list the models of equipment on which they trained.

The classroom instruction covers the following subject matters: rules and guidelines, authorization and attitude; introduction to scissor lift training; safety rules and common hazards; Occupational Health and Safety; workbook and record of training (ROT)

The conclusion of the in-class section is finished with a written exam.

Practical hands-on training comprises instruction on the following: safety equipment; pre-operational inspection; regular maintenance; function checklist; operator's manual and the practical session would end with a proficiency demonstration.
