

## Langley Manlift Certification

Langley Manlift Certification - The Elevated Platforms and Manlifts Certification program helps to provide the required training on the work practices, safe operating procedures, rules and regulations regarding the everyday activities for the operators of this machinery. The program has been designed for people who are actively involved in these activities or those who have a basic understanding of this equipment.

During the last couple of decades, aerial platforms and manlifts have become a common sight in industrial maintenance applications and on construction job sites. These machinery provide an easy way to lift employees close to what must be performed on a stable platform apparatus, enabling staff to do tasks with greater comfort and safety rather than being perched on top of ladders or scaffoldings.

Similar to every other tool, manlifts are just safe if they are used properly. Because they elevate staff above floor or ground level, accidents could happen easily and this might cause serious injuries or death for both the operators of the manlift and whoever passerby who may not be lucky enough to be standing below.

Manlifts come in various kinds. Most fit into 1 or 2 categories: the scissor lift, that is capable of moving upward and downward and the articulating boom lift, which could move both horizontally and vertically.

### Protecting Staff

Correct training is vital when it comes to safety matters. A lot of the businesses which lease manlifts will offer training at the jobsite. Each and every worker who would be working on the machine or operating it should receive training in safe operations. It is likewise vital that only those employees who have received training should be authorized to operate the controls. Operating procedures and communication rules must be clear. Therefore, staff on the ground should not operate controls without the knowledge and approval of any workers inside the basket.

The workers that occupy the basket will be required to wear the proper fall protection gear which comprises a lanyard and harness. The fall protection attaches to the manlift easily. The worker has to make sure that he or she has made whichever adjustments needed to reflect the change in fall distance if the height of the work area changes.

Manlifts must be tested and inspected each day to make certain they are in safe operating condition. Prior to the equipment being used, any defects must be re-checked and repaired.
